the covid 19 pandemic has increased the focus on health informatics and healthcare technology for policy makers and healthcare professionals worldwide this book contains the 110 papers from 160 submissions accepted for the 18th annual international conference on informatics management and technology in healthcare icimth 2020 held virtually in athens greece from 3 5 july 2020 the conference attracts scientists working in the field of biomedical and health informatics from all continents and this year it was held as a virtual conference by means of teleconferencing due to the covid 19 pandemic and the consequent lockdown in many countries around the world the call for papers for the conference started in december 2019 when signs of the new virus infection were not yet evident so early submissions were on the usual topics as announced but papers submitted after mid march were mostly focused on the first results of the pandemic analysis with respect to informatics in different countries and with different perspectives of the spread of the virus and its

influence on public health across the world this book therefore includes papers on the topic of the covid 19 pandemic in relation to informatics reporting from hospitals and institutions from around the world including south korea europe and the usa the book encompasses the field of biomedical and health informatics in a very broad framework and the timely inclusion of papers on the current pandemic will make it of particular interest to all those involved in the provision of healthcare everywhere

as the world s population approaches seven billion people it is vital to find methods of livestock production energy generation and organic waste utilization that are sustainable for the future livestock manure has long been valued as a fertilizer and soil amendment and more recently as a methane producer for heat and power via anaerobic digestion and microbial fuel cells mfc may offer an additional opportunity to gain value through direct electrical generation with little reduction in the manure s soil building value while concurrently reducing the manure s pollution potential we demonstrate that simple lab scale mfcs capable of electrical production can be used with dairy manure and the microorganisms needed for electrical generation are endogenously present the mfcs had an average internal resistance of 136 ohms the mfc system was operated with various raw manure concentrations 0 100 g l cod at 20 oc generating a maximum power density of 138 19 mw m² cod 100 g l power production was proportional to manure strength over this cod range the mfcs where tested at 20 37 and 55 oc average total coulombs c captured increased from 18 8 1 3 to 40 5 2 4 c from 20 to 37 oc but fell to less than 1 42 c at 55 oc indicating that the electrochemically active bacteria are possibly inhibited and killed at thermophilic temperatures coulombic efficiency also increased from 3 4 1 2 to 5 8 1 4 when the temperature was increased from 20 to 37 oc mfcs were combined with ad ad bottles were measured for total biogas production and composition during a 45 day period at 37 oc operating a mfc before ad did not have a statistically significant impact on the amount of biogas produced however the mfc operation did affect the timing and rate of biogas production for some of the samples biogas production reached a threshold of 5ml as many as 8 days sooner in the bottles that where first operated in a mfc the maximum slope of the biogas curves was decreased by 55 from an average of 2 91 to 1 31 ml day with prior operation in an mfc indicating that the peak production rate was lower the effect of ad digestion on the mfc performance was more significant with a 65 decrease in the total coulombs captured when ad was completed prior to use in a mfc to compare the two processes the respective performance of the two processes was determined by coulombic efficiency and energy captured the mfcs reached a maximum of 7 coulombic efficiency while the ad tests were all over 100 indicating cod destruction was underestimated total energy capture for the mfcs was less than 1 joule while with the ad tests it was 120 220 j both these measures indicate that ad is currently the more efficient process at converting biodegradable substrate into energy however with further research and development mfcs show promise if applied in situations that fit their unique benefits such as operation at temperatures and cod concentrations below that needed for ad examples include ambient temperature manure storage ponds and post digestion substrates abstract
