gene therapy is at the forefront of current techniques that aim to re establish functional connectivity after an insult to the brain spinal cord or peripheral nerves gene therapy makes the most of the existing cellular machinery and anatomical networks to facilitate molecular changes in dna rna and proteins aiming to repair these disrupted connections for instance gene therapy is currently being used to target genes in conditions including spinal cord injury amyotrophic lateral sclerosis spinal muscular atrophy stroke and multiple sclerosis amongst others the various delivery routes include viral vectors genetically modified cellular implants naked dna rna liposomes cre lox recombination optogenetics and nanoparticles in particular gene therapy aims to restore function by augmenting the expression of neuroprotective axonal growth promoting neurotrophic factors e g bdnf cntf ngf and gdnf etc furthermore the downstream intracellular signalling pathways after receptor activation can also be targeted e g mtor mapk etc on the other hand gene therapy can also be used to downregulate and or remove faulty mutated genes such as those contributing to disease progression or that inhibit axonal regeneration e g sod 1 tdp 43 nogo a mag omgp etc depending on the methodology these genes for instance can be silenced removed or replaced to alleviate the underlying pathology as such gene therapy can transform a largely toxic and inhibitory milieu surrounding a neuronal axonal insult into a growth permissive environment that will ultimately aid neuronal survival and functional regeneration moreover gene therapy has the capacity to target non neuronal cells and can be even used for neuroanatomical tract tracing ultimately the principal outcome of gene therapy is to functionally restore damaged neuronal and or axonal connections irrespective of the system it is being introduced in to this research topic is devoted to work using gene therapy for the both the central and or peripheral nervous system

about 7 million people worldwide are suffering from various inherited neuromuscular diseases gene therapy brings the hope of treating these diseases at their genetic roots muscle gene therapy is the only book dedicated to this topic the first edition was published in 2010 when the field was just about to enter its prime time the progress made since then has been unprecedented the number of diseases that have been targeted by gene therapy has increased tremendously the gene therapy toolbox is expanded greatly with many creative novel strategies such as genome editing and therapy with disease modifying genes most importantly clinical benefits have begun to emerge in human patients to reflect rapid advances in the field we have compiled the second edition of muscle gene therapy with contributions from experts that have conducted gene therapy studies either in animal models and or in human patients the new edition

offers a much needed up to date overview and perspective on the foundation and current status of neuromuscular disease gene therapy it provides a framework to the development and regulatory approval of muscle gene therapy drugs in the upcoming years this book is a must have for anyone who is interested in neuromuscular disease gene therapy including those in the research arena established investigators and trainees in the fields of clinical practice veterinary medicine and basic biomedical sciences funding and regulatory agencies and patient community

addiction to drugs and alcohol is a dynamic and multi faceted disease process in humans with devastating health and financial consequences for the individual and society at large in humans drug and alcohol use disorders i e abuse and dependence are defined by clusters of behavioral symptoms that can be modeled to various degrees in animals hallmark behavioral symptoms associated with drug and alcohol dependence are compulsive drug use loss of control during episodes of drug use the emergence of a negative emotional state in the absence of the drug and chronic relapse vulnerability during drug abstinence the transition to drug dependence is defined by neuroadaptations in brain circuits that in the absence of drugs mediate a variety of critical behavioral and physiological processes including natural reward positive and negative emotional states nociception and feeding chronic drug exposure during the transition to dependence spurs 1 within systems changes in neural circuits that contribute to the acute rewarding effects of the drug and 2 recruitment of brain stress systems neuroendocrine and extra hypothalamic there are substantial genetic contributions to the propensity to use and abuse drugs and drug abuse is highly co morbid with various other psychiatric conditions e g anxiety disorders major depressive disorder that may precede or follow the development of drug use problems across drugs of abuse there are overlapping and dissociable aspects of the behavioral and neural changes that define the transition to dependence even within a single drug people abuse drugs for a variety of reasons the picture is further complicated by the fact that humans often abuse more than one drug concurrently even in the face of these challenges pre clinical and clinical research is making exponential gains into understanding the neurobiology of drug addiction with the advent of new technologies and their combination with traditional approaches the field is able to ask and answer addiction related research questions in increasingly sophisticated ways here we hope to assemble a collection of articles that provide an up to the moment snapshot of the prevailing empirical theoretical and technical directions in the addiction research field we encourage submissions from all investigators working to

understand the neurobiology of addiction especially as it pertains to reward and stress pathways in the brain

cell and gene therapies for neurologic diseases volume 205 comprehensively covers the scientific background translational efforts clinical developments and registered biologics that have entered into clinical practice coverage includes types of therapies available and in development and best practice uses for a variety of neurological disorders including parkinson s huntington s als stroke spinal cord rp demyelination and epilepsy as the emergence of gene and cellular therapeutics has changed the clinical landscape for a variety of disorders and is now ready to do so for neurological diseases these therapeutic modalities currently complement and may in time supplant small molecule drugs summarizes advances in cell and gene therapy for neurological diseases describes the therapies available and in development includes surgical ethical and manufacturing considerations identifies best practices for specific neurological diseases covers huntington s parkinson s als stroke demyelination epilepsy and more
